This is the MTH 452 HW for sections 6.4 and 6.5^{*}. It is due on Thursday, Feb. 24. Also, we will have a quiz then. Orlando M.

Sec. 6.4:

 $6.4.4, \, 6.4.5, \, 6.4.7, \, 6.4.8, \, 6.4.10, \, 6.4.12, \, 6.4.18$

Sec. 6.5 (well, not 6.5 from the book but from the notes)

6.5.1 Let X_1, \ldots, X_n be a random sample from a normal distribution with $\sigma^2 = 64$. a) Show that $C = \{(x_1, \ldots, x_n) : \overline{x} \leq c\}$ is a best critical region for testing $H_0 : \mu = 80$ against $H_1 : \mu = 76$. b) Find *n* and *c* so that $\alpha = 0.05$ and $\beta = 0.05$ approximately.

6.5.2 Let X₁,..., X_n be a random sample of Bernoulli trials with probability of success = p.
a) Show that the best critical region for testing H₀: p = 0.9 against H₁: p = 0.8 can be based on the statistic Y = ∑ⁿ_{ℓ=1} X_ℓ, which is binomial(n, p).
b) If C = {(x₁,...,x_n): ∑ⁿ_{ℓ=1} x_ℓ ≤ 0.85n} and Y = ∑ⁿ_{ℓ=1} X_ℓ, use the normal approximation to the binomial dist. to find the value of n such that α = 0.10 = P(Y ≤ 0.85n; p = 0.9)
c) What is the approximate value of β for the test given in part (b)?
d) Is the test in part (b) a uniformly most powerful critical region for testing H₀: p = 0.9

d) Is the test in part (b) a uniformly most powerful critical region for testing $H_0: p = 0.9$ when the alternative hypothesis is $H_1: p < 0.9$?

6.5.3 Let X₁,..., X_n be a random sample from the normal distribution N(μ, 36).
a) Show that a uniformly most powerful critical region for testing H₀ : μ = 50 against H₁ : μ < 50 is given by C₂ = {(x₁,...,x_n) : x̄ ≤ c}.
b) With this result and the example discussed in class argue that a uniformly most powerful test for testing H₀ : μ = 50 agains H₁ : μ ≠ 50 does not exist.
